

- What does the `rect` function do?

The `rect` function is like a verb in a sentence. All functions are like this, but in the case of `rect`, it helps processing to know what will come after (argument).

- What does the `rectMode` function do?

The `rectMode` function tells processing that you are going to create a rectangle and do it in a certain way. I.e. *`rectMode(center)`* (starts from the center), or `rectMode(corner)`, starting from the corner.

- What is a pixel?

A pixel is a representation of a cartesian space on a screen plane. Specifying a coordinate to draw with processing tells the computer to turn on or off a corresponding pixel.

- What is HSB?

Hue, Saturation and Brightness.
